

Psychology (AQA)

“Education is what survives when what has been learned has been forgotten.” - B.F. Skinner

Psychology is the scientific study of the human mind, the brain and behaviour. Studying Psychology will give students a unique understanding of why people think and behave in the ways that they do. Students will develop knowledge of key psychological theories, concepts and research, and apply this knowledge in a range of contexts, developing skills of analysis, evaluation and critical thinking.

Academic

The study of Psychology is the analysis of human behaviour.

As such, it has widespread applications to a range of careers and higher education courses. Students who study Psychology gain a unique combination of knowledge and skills, combining the scientific methodologies of the natural sciences with the critical analysis and communication skills of the arts and humanities.

Co-Curricular

Our students enjoy a plethora of extracurricular events and activities to help aid their studies.

Trips to conferences, including the Psychology in Action Conference, are as standard. These thought-provoking events are accompanied by talks from a range of speakers, including psychologists working in research and practice, who visit school to talk to students on a regular basis.
